A microfluidic array for real-time live-cell imaging of human and rodent pancreatic islets

Jin Lee

Senior Solution Engineer @ Microsoft | Driving Technical Wins in Azure AI, App Innovation & Secure DevOps
Chicago, Illinois, United States

Summary

As a Senior Solution Engineer at Microsoft, I help healthcare and life sciences organizations achieve technical success by leading architecture design sessions, driving technical decisions, and enabling innovation with Azure AI, App Development, and secure DevOps practices. Passionate about turning vision into reality, I focus on accelerating adoption of cloud-native and AI-driven solutions that deliver measurable business outcomes.

Experience

Microsoft

4 years 6 months

Senior Solutions Engineer

September 2025 - Present (8 months)

- Drive technical win strategy and decision-making for enterprise accounts.
- Lead whiteboarding, demos, and proof-of-concept engagements for Azure AI, App Innovation, and security solutions.
- Partner with Specialists, CSAMs, and GBBs to deliver value-based outcomes and accelerate time-to-production.

Cloud Solutions Architect

July 2022 - September 2025 (3 years 3 months)

Chicago, Illinois, United States

AI-Powered Contact Center Transformation

Co-led the architecture and deployment of a real-time AI voice agent for a Fortune 50 insurance provider, leveraging Azure Communication Services, OpenAI, Speech Services, and Cosmos DB. Delivered a scalable, modular platform designed to process 1–2M calls annually, targeting \$13–18M in cost savings and improved patient/member experience. Production launch targeted for early 2026.

AutoAuth – AI-Powered Prior Authorization Automation

Designed and delivered an agentic AI workflow using Azure OpenAI, Retrieval-Augmented Generation (RAG), and clinical summarization to automate prior authorization for payors. Achieved 95% precision in document summarization, doubled throughput for clinical case review, and enabled \$18M in projected annual savings.

DevSecOps & Infrastructure as Code (IaC) Enablement

Led secure DevOps and IaC transformation engagements using Terraform, GitHub Advanced Security, and Azure-native tooling. Helped healthcare and finance customers migrate from on-prem and AWS to Azure. Reduced environment onboarding by 10+ days and increased deployment velocity by 300–400% through automation and security-first design.

AI Advocacy & Hackathon Enablement

Mentored teams during global Microsoft AI hackathons, enabling rapid prototyping with Azure OpenAI, Cognitive Services, and AI Search. Delivered technical coaching, architecture reviews, and GTM alignment, resulting in follow-on customer engagements and ACR growth.

Customer Engineer

November 2021 - July 2022 (9 months)

Chicago, Illinois, United States

GE Healthcare

2 years 10 months

Staff Software Engineer

April 2021 - November 2021 (8 months)

Chicago, Illinois, United States

As a Staff Engineer on the CTO platform team, I led development efforts to create a scalable, code-driven, enterprise-compliant Azure environment. Key accomplishments include:

- Developed Ansible playbooks for automated patching of Linux and Windows servers, standardizing security and monitoring software
- Designed and implemented Azure Kubernetes Service for enterprise application migrations, integrating with CI/CD processes using Terragrunt, Terraform, Helm, and Azure DevOps

- Evaluated new technologies and created PoCs for integration potential
- Maintained Azure DevOps infrastructure pipelines to ensure adherence to evolving standards
- Mentored cross-functional teams in code-driven processes, increasing collaboration and team velocity
- Collaborated with networking and technical teams to secure networking requirements and integrate existing processes
- Worked with non-technical leaders to translate requirements into actionable Scrum tasks

Senior Build and Release Engineer

August 2019 - April 2021 (1 year 9 months)

Chicago, IL

As a Senior Engineer on the CTO platform team, I contributed to the transition from AWS to Azure, focusing on Infrastructure as Code (IaC) and ramping up skilling on the Azure platform. Prior to this, I worked on the Transformation platform team to deliver containerized application migrations on AWS.

CTO Platform:

- Designed and implemented Azure architecture, including AD access strategies, vnet and subnet configurations, and secret/certificate management
- Automated cloud operations using Terragrunt, Terraform, Azure DevOps, and Git Flow
- Developed automated secret and certificate rotation strategies with Python, Docker, ACI, and App GW
- Led development and PoC efforts for iterative improvements and functionality onboarding
- Collaborated with management to prioritize development based on business needs

Transformation Platform:

- Implemented Docker Swarm infrastructure and development processes in AWS with Terraform, S3, and Jenkins
- Assisted application teams with onboarding and migration to container orchestration platforms
- Collaborated with cross-functional teams to prioritize tasks and drive cooperation
- Developed serverless applications in AWS for custom tooling to interface with EKS migration processes

- Documented processes and created diagrams to enhance engagement and team velocity

Gibraltar Cloud Platform Engineer

February 2019 - August 2019 (7 months)

Greater Chicago Area

During the last rotation of my Digital Technology Leadership Program, I joined the Stratos Transformation team for the initial rollout of their AWS-based application migration initiative. In this fast-paced, high-visibility environment, I:

- Collaborated with senior engineers to enhance CICD processes, reducing deployment complexity and expanding functionality based on business needs
- Worked on various projects involving frontend UI/UX development in Angular, backend API development in NodeJS, and infrastructure development using Terraform, Ansible, and Helm
- Developed an API to integrate deployment pipelines with EKS, enabling users to onboard services without direct infrastructure configuration
- Partnered with the team architect to diagram and document processes, driving engagement and aligning onboarding teams with the team's vision

GE Digital

2 years

Digital Technology Leadership Program

June 2017 - May 2019 (2 years)

New Orleans, Louisiana

Two-year leadership development program where members work within a GE business alongside experts in various locations.

Four, six-month rotational assignments touching upon different areas of the business with unique challenges to accelerate growth in both soft and hard skills.

Frontend Developer

August 2018 - February 2019 (7 months)

Miami, Florida

Paired with a senior frontend engineer to develop the initial foundations for a dashboard application that interfaced with Azure AD to help executives and managers visualize the cost and collection of their assets.

- Collaborated with cross functional team members to wireframe and document initial foundations for the ReactJS application
- Worked closely with management to executive level stakeholders to present and drive discussions to capture UI and UX requirements

- Learned frontend development concepts and worked heavily with ReactJs and Redux state management to lay out the initial frontend foundations
- Collaborated with senior backend engineers to design and implement NodeJS api, MongoDB, Azure AD stack to actively develop the frontend application with live data

Infrastructure Product Development - Network/WAN

February 2018 - August 2018 (7 months)

Cincinnati, Ohio

Worked with a team of DTLPs to join a significant CoreTech transformation effort to modernize legacy MPLS based network to a software-defined internet fabric within AWS. High visibility and fast paced environment with the initiative of migrating 1000 (of 3000+) sites and deliver significant cost savings across the various GE businesses as well as improve user experience.

- Worked closely with technical leads to create a serverless RBAC module interfacing with enterprise AD with AWS Lambda, AWS, RDS, and API Gateway that was managed through Terraform
- RBAC module enabled us to securely access system Terraform modules for VPC build automation that can be re-used for future deployments and effectively decreased deployment time by over 95%
- Worked closely with technical leads to design, develop, and implement Ansible Tower specific authorization model using said RBAC module to allow automated and code driven security layer to protect crucial network automation
- Regularly presented to senior executives to pitch potential projects and ongoing value being delivered

Mentored and collaborated with summer software interns to quickly onboard and accelerate our overall development processes

Digital Commercial ITSM Developer

July 2017 - February 2018 (8 months)

New Orleans, Louisiana

Work in GE Digital's centralized ITSM system (ServiceNow) team during their initiative to modernize and onboard workflows from all GE businesses. While working and learning Fastworks and agile methodologies, deliver solutions to expand the functionality of the ServiceNow platform and support onboarding processes from end-to-end.

- Worked iteratively with a platform architect to quickly learn and develop functionality on the platform using Javascript, Java, Ajax, and html
- Pitched to managers across the GE businesses to accelerate adoption of our solution and find onboarding targets

- Worked closely with architects to effectively capture customer requirements and define prework to prepare migrations
- Lead collaborative efforts with a team of interns to quickly resolve outages and defects

Northern Illinois University
PAL/ACCESS Tutoring Supervisor
May 2014 - January 2017 (2 years 9 months)
DeKalb, Illinois

Supervised university tutors from various backgrounds in multiple locations to ensure maximum efficiency. Concurrently tutored students in mathematics, computer science, engineering, and physics courses.

GE Digital
Early Identification (EID) Software Developer Intern
January 2016 - August 2016 (8 months)
Lisle, Illinois

Worked with the Industrial Performance Reliability Center (IPRC) to ensure engineers had the tools to work at utmost efficiency. Created a modular and scalable custom compiler using SmartSignal's custom Menlo language which was used as the back bone for many other projects.

Elemech, Inc.
Engineering Intern
May 2015 - August 2015 (4 months)
Aurora, Illinois

By using JavaScript/HTML5 and MySQL, created EleMech's first Machine-to-Machine hybrid application. Additionally, developed expertise in creating PIDs, PLC programming, and creating ladder diagrams.

i-Kaist
Software Developer Intern
June 2014 - August 2014 (3 months)
Yuseong-gu, Daejeon, Korea

Through aiding in development operations in iKaist's flagship software, SchoolBox, developed skills in C#, .Net, and presentation.

University of Illinois at Chicago
Lab Assistant at UIC Department of Surgery
June 2013 - July 2014 (1 year 2 months)

Aided in research processes for multiple teams, developed expertise in multi-physics simulations through Solidworks and Comsol, and coauthored a research publication in a new way to entrap islet cells within microfluidic devices for microscopy and experiments.
